LOGCHECK: An API to Detect Cyber Bullying
Sai Preethi Vishwanathan

ABSTRACT
In the recent years, with the advent of high-speed internet and cell phone access, a proportion of teenagers took bullying from school hallways to cyberspace. Technology greatly benefits anyone by allowing immediate access to information. On the contrary, it is the same technology that allows the wrongdoers to exploit the innocent, commit crimes and used as a weapon to harass and stalk people. Therefore parents and caretakers should take up the responsibility to help their kids to stay safe online. Many researchers analyzed the prevalence of cyber bullying, it’s social and psychological effects on the minds of children and also provided ways to teach youngsters about the importance of healthy communication. But only a handful considered technology as a tool to detect and help teenagers from cyber bullying. In this paper, we proposed a dashboard like interface for parents to detect cyber bullying in the early stages and help their kids to psychologically tackle the problems that arise from a particular situation.
